Introduction

A periodic loading is characterized by the identity

$$p(t) = p(t + T)$$

where  $T$  is the *period* of the loading, and  $\omega_1 = \frac{2\pi}{T}$  is its *principal frequency*.

Note that a function with period  $T/n$  is also periodic with period  $T$ .

Response to General Dynamic Loadings

Introduction

Periodic loadings can be expressed as an infinite series of harmonic functions using the Fourier theorem, e.g., for an antisymmetric loading you can write

$$p(t) = -p(-t) = \sum_{j=1}^{\infty} p_j \sin j\omega_1 t = \sum_{j=1}^{\infty} p_j \sin \omega_j t.$$

The steady-state response of a SDOF system for a harmonic loading  $\Delta p_j(t) = p_j \sin \omega_j t$  is known; with  $\beta_j = \omega_j/\omega_n$  it is:

$$x_{j,s-s} = \frac{p_j}{k} D(\beta_j, \zeta) \sin(\omega_j t - \theta(\beta_j, \zeta)).$$

In general, it is possible to sum all steady-state responses, the infinite series giving the *SDOF* response to  $p(t)$ .

Due to the asymptotic behaviour of  $D(\beta; \zeta)$  ( $D$  goes to zero for large, increasing  $\beta$ ) it is apparent that a good approximation to the steady-state response can be obtained using a limited number of low-frequency terms.

Fourier Series

Using Fourier theorem any *practical* periodic loading can be expressed as a series of harmonic loading terms.

Consider a loading of period  $T_p$ , its Fourier series is given by

$$p(t) = a_0 + \sum_{j=1}^{\infty} a_j \cos \omega_j t + \sum_{j=1}^{\infty} b_j \sin \omega_j t, \quad \omega_j = j \omega_1 = j \frac{2\pi}{T_p},$$

where the harmonic amplitude coefficients have expressions:

$$a_0 = \frac{1}{T_p} \int_0^{T_p} p(t) dt, \quad a_j = \frac{2}{T_p} \int_0^{T_p} p(t) \cos \omega_j t dt,$$
$$b_j = \frac{2}{T_p} \int_0^{T_p} p(t) \sin \omega_j t dt,$$

as, by orthogonality,

$$\int_0^{T_p} p(t) \cos \omega_j t dt = \int_0^{T_p} a_j \cos^2 \omega_j t dt = \frac{T_p}{2} a_j, \text{ etc etc.}$$

## Fourier Coefficients

Response to Periodic Loading  
Introduction  
Fourier Series Representation  
Fourier Series of the Response  
An example  
Fourier Transform  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

If  $p(t)$  has not an analytical representation and must be measured experimentally or computed numerically, we may assume that it is possible

- (a) to divide the period in  $N$  equal parts  $\Delta t = T_p/N$ ,
- (b) measure or compute  $p(t)$  at a discrete set of instants  $t_1, t_2, \dots, t_N$ , with  $t_m = m\Delta t$ ,

obtaining a discrete set of values  $p_m$ ,  $m = 1, \dots, N$  (note that  $p_0 = p_N$  by periodicity).

Using the trapezoidal rule of integration, with  $p_0 = p_N$  we can write, for example, the cosine-wave amplitude coefficients,

$$a_j \approx \frac{2\Delta t}{T_p} \sum_{m=1}^N p_m \cos \omega_j t_m$$

$$= \frac{2}{N} \sum_{m=1}^N p_m \cos(j\omega_1 m\Delta t) = \frac{2}{N} \sum_{m=1}^N p_m \cos \frac{jm2\pi}{N}.$$

It's worth to note that the discrete function  $\cos \frac{jm2\pi}{N}$  is periodic with period  $N$ .

## Exponential Form

Giacomo Boffi

Response to Periodic Loading  
Introduction  
Fourier Series Representation  
Fourier Series of the Response  
An example  
Fourier Transform  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

The Fourier series can be written in terms of the exponentials of imaginary argument,

$$p(t) = \sum_{j=-\infty}^{\infty} P_j \exp i\omega_j t$$

where the complex amplitude coefficients are given by

$$P_j = \frac{1}{T_p} \int_0^{T_p} p(t) \exp i\omega_j t \, dt, \quad j = -\infty, \dots, +\infty.$$

For a sampled  $p_m$  we can write, using the trapezoidal integration rule and substituting  $t_m = m\Delta t = mT_p/N$ ,  $\omega_j = j2\pi/T_p$ :

$$P_j \approx \frac{1}{N} \sum_{m=1}^N p_m \exp(-i\frac{2\pi j m}{N}),$$

## Undamped Response

Introduction  
Fourier Series Representation  
Fourier Series of the Response  
An example  
Fourier Transform  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

We have seen that the steady-state response to the  $j$ th sine-wave harmonic can be written as

$$x_j = \frac{b_j}{k} \left[ \frac{1}{1 - \beta_j^2} \right] \sin \omega_j t, \quad \beta_j = \omega_j / \omega_n,$$

analogously, for the  $j$ th cosine-wave harmonic,

$$x_j = \frac{a_j}{k} \left[ \frac{1}{1 - \beta_j^2} \right] \cos \omega_j t.$$

Finally, we write

$$x(t) = \frac{1}{k} \left\{ a_0 + \sum_{j=1}^{\infty} \left[ \frac{1}{1 - \beta_j^2} \right] (a_j \cos \omega_j t + b_j \sin \omega_j t) \right\}.$$

## Damped Response

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Introduction  
Fourier Series Representation  
Fourier Series of the Response  
An example  
Fourier Transform  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

In the case of a damped oscillator, we must substitute the steady state response for both the  $j$ th sine- and cosine-wave harmonic,

$$x(t) = \frac{a_0}{k} + \frac{1}{k} \sum_{j=1}^{\infty} \frac{+(1 - \beta_j^2) a_j - 2\zeta\beta_j b_j}{(1 - \beta_j^2)^2 + (2\zeta\beta_j)^2} \cos \omega_j t +$$

$$+ \frac{1}{k} \sum_{j=1}^{\infty} \frac{+2\zeta\beta_j a_j + (1 - \beta_j^2) b_j}{(1 - \beta_j^2)^2 + (2\zeta\beta_j)^2} \sin \omega_j t.$$

As usual, the exponential notation is neater,

$$x(t) = \sum_{j=-\infty}^{\infty} \frac{P_j}{k} \frac{\exp i\omega_j t}{(1 - \beta_j^2) + i(2\zeta\beta_j)}.$$

As an example, consider the loading  $p(t) = \max\{p_0 \sin \frac{2\pi t}{T_p}, 0\}$

$$a_0 = \frac{1}{T_p} \int_0^{T_p/2} p_0 \sin \frac{2\pi t}{T_p} \, dt = \frac{p_0}{\pi},$$

$$a_j = \frac{2}{T_p} \int_0^{T_p/2} p_0 \sin \frac{2\pi t}{T_p} \cos \frac{2\pi j t}{T_p} \, dt$$

$$= \begin{cases} 0 & \text{for } j \text{ odd} \\ \frac{p_0}{\pi} \left[ \frac{2}{1 - j^2} \right] & \text{for } j \text{ even,} \end{cases}$$

$$b_j = \frac{2}{T_p} \int_0^{T_p/2} p_0 \sin \frac{2\pi t}{T_p} \sin \frac{2\pi j t}{T_p} \, dt = \begin{cases} \frac{p_0}{2} & \text{for } j = 1 \\ 0 & \text{for } n > 1. \end{cases}$$

## Example cont.

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Introduction  
Fourier Series Representation  
Fourier Series of the Response  
An example  
Fourier Transform  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

Assuming  $\beta_1 = 3/4$ , from  $p = \frac{p_0}{\pi} (1 + \frac{\pi}{2} \sin \omega_1 t - \frac{2}{3} \cos 2\omega_1 t - \frac{2}{15} \cos 4\omega_1 t - \dots)$  with the dynamic amplification factors

$$D_1 = \frac{1}{1 - (1\frac{3}{4})^2} = \frac{16}{7},$$

$$D_2 = \frac{1}{1 - (2\frac{3}{4})^2} = -\frac{4}{5},$$

$$D_4 = \frac{1}{1 - (4\frac{3}{4})^2} = -\frac{1}{8}, \quad D_6 = \dots$$

etc, we have

$$x(t) = \frac{p_0}{k\pi} \left( 1 + \frac{8\pi}{7} \sin \omega_1 t + \frac{8}{15} \cos 2\omega_1 t + \frac{1}{60} \cos 4\omega_1 t + \dots \right)$$

Take note, these solutions are particular solutions! If your solution has to respect given initial conditions, you must consider also the homogeneous solution.

Response to General Dynamic Loadings

## Non periodic loadings

SDOF linear oscillator  
Giacomo Boffi

It is possible to extend the Fourier analysis to non periodic loading. Let's start from the Fourier series representation of the load  $p(t)$ ,

$$p(t) = \sum_{-\infty}^{+\infty} P_r \exp(i\omega_r t), \quad \omega_r = r\Delta\omega, \quad \Delta\omega = \frac{2\pi}{T_p},$$

introducing  $P(i\omega_r) = P_r T_p$  and substituting,

$$p(t) = \frac{1}{T_p} \sum_{-\infty}^{+\infty} P(i\omega_r) \exp(i\omega_r t) = \frac{\Delta\omega}{2\pi} \sum_{-\infty}^{+\infty} P(i\omega_r) \exp(i\omega_r t).$$

Due to periodicity, we can modify the extremes of integration in the expression for the complex amplitudes,

$$P(i\omega_r) = \int_{-T_p/2}^{+T_p/2} p(t) \exp(-i\omega_r t) dt.$$

Response to Periodic Loading  
Fourier Transform  
Extension of Fourier Series to non periodic functions  
Response in the Frequency Domain  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

## Non periodic loadings (2)

SDOF linear oscillator  
Giacomo Boffi

If the loading period is extended to infinity to represent the non-periodicity of the loading ( $T_p \rightarrow \infty$ ) then (a) the frequency increment becomes infinitesimal ( $\Delta\omega = \frac{2\pi}{T_p} \rightarrow d\omega$ ) and (b) the discrete frequency  $\omega_r$  becomes a continuous variable,  $\omega$ . In the limit, for  $T_p \rightarrow \infty$  we can then write

$$p(t) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} P(i\omega) \exp(i\omega t) d\omega$$

$$P(i\omega) = \int_{-\infty}^{+\infty} p(t) \exp(-i\omega t) dt,$$

which are known as the inverse and the direct Fourier Transforms, respectively, and are collectively known as the Fourier transform pair.

Fourier Transform  
Extension of Fourier Series to non periodic functions  
Response in the Frequency Domain  
The Discrete Fourier Transform  
Response to General Dynamic Loadings

## SDOF Response

SDOF linear oscillator  
Giacomo Boffi

In analogy to what we have seen for periodic loads, the response of a damped SDOF system can be written in terms of  $H(i\omega)$ , the complex frequency response function,

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} H(i\omega) P(i\omega) \exp(i\omega t) d\omega, \quad \text{where}$$

$$H(i\omega) = \frac{1}{k} \left[ \frac{1}{(1-\beta^2) + i(2\zeta\beta)} \right] = \frac{1}{k} \left[ \frac{(1-\beta^2) - i(2\zeta\beta)}{(1-\beta^2)^2 + (2\zeta\beta)^2} \right], \quad \beta = \frac{\omega}{\omega_n}.$$

To obtain the response *through frequency domain*, you should evaluate the above integral, but analytical integration is not always possible, and when it is possible, it is usually very difficult, implying contour integration in the complex plane (for an example, see Example **E6-3** in Clough Penzien).

Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

To overcome the analytical difficulties associated with the inverse Fourier transform, one can use appropriate numerical methods, leading to good approximations. Consider a loading of finite period  $T_p$ , divided into  $N$  equal intervals  $\Delta t = T_p/N$ , and the set of values  $p_s = p(t_s) = p(s\Delta t)$ . We can approximate the complex amplitude coefficients with a sum,

$$P_r = \frac{1}{T_p} \int_0^{T_p} p(t) \exp(-i\omega_r t) dt, \quad \text{that, by trapezoidal rule, is}$$

$$\cong \frac{1}{N\Delta t} \left( \Delta t \sum_{s=0}^{N-1} p_s \exp(-i\omega_r t_s) \right) = \frac{1}{N} \sum_{s=0}^{N-1} p_s \exp(-i\frac{2\pi rs}{N}).$$

## Discrete Fourier Transform (2)

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

In the last two passages we have used the relations  
 $p_N = p_0, \quad \exp(i\omega_r t_N) = \exp(ir\Delta\omega T_p) = \exp(ir2\pi) = \exp(i0)$   
 $\omega_r t_s = r\Delta\omega s\Delta t = rs \frac{2\pi}{T_p} \frac{T_p}{N} = \frac{2\pi rs}{N}.$

Take note that the discrete function  $\exp(-i\frac{2\pi rs}{N})$ , defined for integer  $r, s$  is periodic with period  $N$ , implying that the complex amplitude coefficients are themselves periodic with period  $N$ .  
 $P_{r+N} = P_r$

Starting in the time domain with  $N$  distinct complex numbers,  $p_s$ , we have found that in the frequency domain our load is described by  $N$  distinct complex numbers,  $P_r$ , so that we can say that our function is described by the same amount of information in both domains.

## Aliasing

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

Only  $N/2$  distinct frequencies ( $\sum_{s=0}^{N-1} = \sum_{s=-N/2}^{+N/2}$ ) contribute to the load representation, what if the *frequency content* of the loading has contributions from frequencies higher than  $\omega_{N/2}$ ? What happens is *aliasing*, i.e., the upper frequencies contributions are mapped to contributions of lesser frequency. See the plot above: the contributions from the high frequency sines, *when sampled*, are indistinguishable from the contributions from lower frequency components, i.e., are *aliased* to lower frequencies!

## Aliasing (2)

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

- The maximum frequency that can be described in the DFT is called the Nyquist frequency,  $\omega_{Ny} = \frac{1}{2} \frac{2\pi}{\Delta t}$ .
- It is usual in signal analysis to remove the signal's higher frequency components preprocessing the signal with a *filter* or a *digital filter*.
- It is worth noting that the *resolution* of the DFT in the frequency domain for a given sampling rate is proportional to the number of samples, i.e., to the duration of the sample.

## The Fast Fourier Transform

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

The operation count in a DFT is in the order of  $N^2$ . A Fast Fourier Transform is an algorithm that reduces the operation count. The first and simpler FFT algorithm is the *Decimation in Time* algorithm by Tukey and Cooley (1965). Assume  $N$  is even, and divide the DFT summation to consider even and odd indices  $s$

$$X_r = \sum_{s=0}^{N-1} x_s e^{-\frac{2\pi i}{N} sr}, \quad r = 0, \dots, N-1$$

$$= \sum_{q=0}^{N/2-1} x_{2q} e^{-\frac{2\pi i}{N} (2q)r} + \sum_{q=0}^{N/2-1} x_{2q+1} e^{-\frac{2\pi i}{N} (2q+1)r}$$

collecting  $e^{-\frac{2\pi i}{N} r}$  in the second term and letting  $\frac{2q}{N} = \frac{q}{N/2}$

$$= \sum_{q=0}^{N/2-1} x_{2q} e^{-\frac{2\pi i}{N/2} qr} + e^{-\frac{2\pi i}{N} r} \sum_{q=0}^{N/2-1} x_{2q+1} e^{-\frac{2\pi i}{N/2} qr}$$

We have two DFT's of length  $N/2$ , the operations count is hence  $2(N/2)^2 = N^2/2$ , but we have to combine these two halves in the full DFT.

## The Fast Fourier Transform

SDOF linear oscillator  
Giacomo Boffi

Response to Periodic Loading  
Fourier Transform  
The Discrete Fourier Transform  
Aliasing  
The Fast Fourier Transform  
Response to General Dynamic Loadings

Say that

$$X_r = E_r + e^{-\frac{2\pi i}{N} r} O_r$$

where  $E_r$  and  $O_r$  are the even and odd half-DFT's, of which we computed only coefficients from 0 to  $N/2 - 1$ . To get the full sequence we have to note that

1. the  $E$  and  $O$  DFT's are periodic with period  $N/2$ , and
2.  $\exp(-2\pi i(r+N/2)/N) = e^{-\pi i} \exp(-2\pi ir/N) = -\exp(-2\pi ir/N)$ ,

so that we can write

$$X_r = \begin{cases} E_r + \exp(-2\pi ir/N) O_r & \text{if } r < N/2, \\ E_{r-N/2} - \exp(-2\pi ir/N) O_{r-N/2} & \text{if } r \geq N/2. \end{cases}$$

The algorithm that was outlined can be applied to the computation of each of the half-DFT's when  $N/2$  were even, so that the operation count goes to  $N^2/4$ . If  $N/4$  were even ...

Response to infinitesimal impulse

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

An approximate procedure to evaluate the maximum displacement for a short impulse loading is based on the impulse-momentum relationship,

$$m\Delta\dot{x} = \int_0^{t_0} [p(t) - kx(t)] dt.$$

When one notes that, for small  $t_0$ , the displacement is of the order of  $t_0^2$  while the velocity is in the order of  $t_0$ , it is apparent that the  $kx$  term may be dropped from the above expression, i.e.,

$$m\Delta\dot{x} \approx \int_0^{t_0} p(t) dt.$$

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

Using the previous approximation, the velocity at time  $t_0$  is

$$\dot{x}(t_0) = \frac{1}{m} \int_0^{t_0} p(t) dt,$$

and considering again a negligibly small displacement at the end of the loading,  $x(t_0) \approx 0$ , one has

$$x(t - t_0) \approx \frac{1}{m\omega_n} \int_0^{t_0} p(t) dt \sin \omega_n(t - t_0).$$

Please note that the above equation is exact for an infinitesimal impulse loading.

Giacomo Boffi

Response to Periodic Loading

Fourier Transform

The Discrete Fourier Transform

Response to General Dynamic Loadings

Response to infinitesimal impulse

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

For an infinitesimal impulse, the impulse-momentum is exactly  $p(\tau) d\tau$  and the response is

$$dx(t - \tau) = \frac{p(\tau) d\tau}{m\omega_n} \sin \omega_n(t - \tau), \quad t > \tau,$$

and to evaluate the response at time  $t$  one has simply to sum all the infinitesimal contributions for  $\tau < t$ ,

$$x(t) = \frac{1}{m\omega_n} \int_0^t p(\tau) \sin \omega_n(t - \tau) d\tau, \quad t > 0.$$

This relation is known as the Duhamel integral, and tacitly depends on initial rest conditions for the system.

The Discrete Fourier Transform

Response to General Dynamic Loadings

Response to infinitesimal impulse

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

The derivation of the equation of motion for a generic load is analogous to what we have seen for undamped SDOF, the infinitesimal contribution to the response at time  $t$  of the load at time  $\tau$  is

$$dx(t) = \frac{p(\tau)}{m\omega_D} d\tau \sin \omega_D(t - \tau) \exp(-\zeta\omega_n(t - \tau)) \quad t \geq \tau$$

and integrating all infinitesimal contributions one has

$$x(t) = \frac{1}{m\omega_D} \int_0^t p(\tau) \sin \omega_D(t - \tau) \exp(-\zeta\omega_n(t - \tau)) d\tau, \quad t \geq 0.$$

Damped SDOF systems

Relationship between time and frequency domain

Using the trig identity

$$\sin(\omega_n t - \omega_n \tau) = \sin \omega_n t \cos \omega_n \tau - \cos \omega_n t \sin \omega_n \tau$$

the Duhamel integral is rewritten as

$$\begin{aligned} x(t) &= \frac{\int_0^t p(\tau) \cos \omega_n \tau d\tau}{m\omega_n} \sin \omega_n t - \frac{\int_0^t p(\tau) \sin \omega_n \tau d\tau}{m\omega_n} \cos \omega_n t \\ &= \mathcal{A}(t) \sin \omega_n t - \mathcal{B}(t) \cos \omega_n t \end{aligned}$$

where

$$\begin{cases} \mathcal{A}(t) = \frac{1}{m\omega_n} \int_0^t p(\tau) \cos \omega_n \tau d\tau \\ \mathcal{B}(t) = \frac{1}{m\omega_n} \int_0^t p(\tau) \sin \omega_n \tau d\tau \end{cases}$$

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

Usual numerical procedures can be applied to the evaluation of  $\mathcal{A}$  and  $\mathcal{B}$ , e.g., using the trapezoidal rule, one can have, with  $\mathcal{A}_N = \mathcal{A}(N\Delta\tau)$  and  $\mathcal{Y}_N = p(N\Delta\tau) \cos(N\Delta\tau)$

$$\mathcal{A}_{N+1} = \mathcal{A}_N + \frac{\Delta\tau}{2m\omega_n} (\mathcal{Y}_N + \mathcal{Y}_{N+1}).$$

## Evaluation of Duhamel integral, damped

For a damped system, it can be shown that

$$x(t) = \mathcal{A}(t) \sin \omega_D t - \mathcal{B}(t) \cos \omega_D t$$

with

$$\mathcal{A}(t) = \frac{1}{m\omega_D} \int_0^t p(\tau) \frac{\exp \zeta \omega_n \tau}{\exp \zeta \omega_n t} \cos \omega_D \tau d\tau,$$

$$\mathcal{B}(t) = \frac{1}{m\omega_D} \int_0^t p(\tau) \frac{\exp \zeta \omega_n \tau}{\exp \zeta \omega_n t} \sin \omega_D \tau d\tau.$$

## Transfer Functions

The response of a linear SDOF system to arbitrary loading can be evaluated by a convolution integral in the time domain,

$$x(t) = \int_0^t p(\tau) h(t - \tau) d\tau,$$

with the unit impulse response function

$h(t) = \frac{1}{m\omega_D} \exp(-\zeta \omega_n t) \sin(\omega_D t)$ , or through the frequency domain using the Fourier integral

$$x(t) = \int_{-\infty}^{+\infty} H(\omega) P(\omega) \exp(i\omega t) d\omega,$$

where  $H(\omega)$  is the complex frequency response function.

## Transfer Functions

These response functions, or *transfer* functions, are connected by the direct and inverse Fourier transforms:

$$H(\omega) = \int_{-\infty}^{+\infty} h(t) \exp(-i\omega t) dt,$$

$$h(t) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} H(\omega) \exp(i\omega t) d\omega.$$

Fourier Transform

The Discrete Fourier Transform

Response to General Dynamic Loadings

Response to infinitesimal impulse

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

## Relationship of transfer functions

We write the response and its Fourier transform:

$$x(t) = \int_0^t p(\tau) h(t - \tau) d\tau = \int_{-\infty}^t p(\tau) h(t - \tau) d\tau$$

$$X(\omega) = \int_{-\infty}^{+\infty} \left[ \int_{-\infty}^t p(\tau) h(t - \tau) d\tau \right] \exp(-i\omega t) dt$$

the lower limit of integration in the first equation was changed from 0 to  $-\infty$  because  $p(\tau) = 0$  for  $\tau < 0$ , and since  $h(t - \tau) = 0$  for  $\tau > t$ , the upper limit of the second integral in the second equation can be changed from  $t$  to  $+\infty$ ,

$$X(\omega) = \lim_{s \rightarrow \infty} \int_{-s}^{+s} \int_{-s}^{+s} p(\tau) h(t - \tau) \exp(-i\omega t) dt d\tau$$

Response to infinitesimal impulse

Numerical integration of Duhamel integral

Undamped SDOF systems

Damped SDOF systems

Relationship between time and frequency domain

## Relationship of transfer functions

Introducing a new variable  $\theta = t - \tau$  we have

$$X(\omega) = \lim_{s \rightarrow \infty} \int_{-s}^{+s} p(\tau) \exp(-i\omega \tau) d\tau \int_{-s-\tau}^{+s-\tau} h(\theta) \exp(-i\omega \theta) d\theta$$

with  $\lim_{s \rightarrow \infty} s - \tau = \infty$ , we finally have

$$\begin{aligned} X(\omega) &= \int_{-\infty}^{+\infty} p(\tau) \exp(-i\omega \tau) d\tau \int_{-\infty}^{+\infty} h(\theta) \exp(-i\omega \theta) d\theta \\ &= P(\omega) \int_{-\infty}^{+\infty} h(\theta) \exp(-i\omega \theta) d\theta \end{aligned}$$

where we have recognized that the first integral is the Fourier transform of  $p(t)$ .

- Response to General Dynamic Loadings
- Response to infinitesimal impulse
- Numerical integration of Duhamel integral
- Undamped SDOF systems
- Damped SDOF systems
- Relationship between time and frequency domain

Our last relation was

$$X(\omega) = P(\omega) \int_{-\infty}^{+\infty} h(\theta) \exp(-i\omega\theta) d\theta$$

but  $X(\omega) = H(\omega)P(\omega)$ , so that, noting that in the above equation the last integral is just the Fourier transform of  $h(\theta)$ , we may conclude that, effectively,  $H(\omega)$  and  $h(t)$  form a Fourier transform pair.
